Toaster - A web interface to the Yocto Project

Belén Barros Pena, David Reyna - Yocto Project

What is demonstrated

Toaster, a **web interface** to the Yocto Project build system (OpenEmbedded and BitBake).

With Toaster you can:

- Configure and run builds via a web browser
- Customise images by adding / removing packages
- View information about the build process:

  - Packages installed
  - Root file system directory structure
  - Variable values and history
  - Error, warning and trace messages
  - Tasks executed and shared state use
  - Dependency relationships between recipes, packages and tasks
  - Performance data (task time, CPU usage, disk I/O)

What was improved

Yocto Project 2.1 "Krogoth" adds the ability to **customise the package content of your images** with Toaster.

New features:

- Create your own custom images
- Add / remove packages to / from your custom images
- Generate and download your custom image recipe (.bb) files
