Current as of August 4th, 2011

Stone Environmental, a small Environmental Sciences firm in Montpelier, Vermont, is seeking a web developer skilled with Microsoft Silverlight v4, for a short-term contract. The developer must be fully proficient in creating Silverlight web applications (especially those using WCF data sources), must be competent at digital graphic design, have strong communication skills, be able to work easily in a team, must be able to come to our Montpelier office for some team work and meetings, and (very importantly) be able to commit to working at up to 20 hours a week for the next few months (perhaps more). There is no expectation that this position will become permanent as it is funded by a specific project.

If the applicant is also skilled in developing web applications using the ESRI ArcGIS Server API for Silverlight, that is a big plus.

Knowledge of environmental modeling, or statistics, is also a plus. A core portion of the project to be done involves creating an interface to view statistical reports of environmental model output using tables, charts, and graphs, at least.

The ability to commit more hours per week of work, especially in bursts of work prior to deadlines, is also a large plus.

Please submit URLs to completed Silverlight applications as a portfolio of previous work, along with the standard resume.

Please contact Joanne Perry at our Montpelier office if you would like to apply.

Ms. Joanne Perry
